

Analysis Overview

This report provides an analysis of development activity within the scottyab/rootbeer repository, focusing on file modification history and contributor activity. By extracting commit data across 16 core files, we tracked 111 distinct file modifications to identify key contributors, pinpoint the most active files, and uncover potential code base dependencies.

Development is heavily concentrated in a single file, File 13, which acts as the functional core of the repository, as it has received the highest volume of activity with 40 separate touches. File 12 is the second most modified with 17 touches and 289 changes. This indicates that any future refactoring or maintenance must prioritize these core components.

The project relies almost entirely on two individuals. The contributor stealthcopter performed the most work overall, contributing 922 total changes, followed closely by the repository owner scottyab, who contributed 440 changes and made the most frequent individual commits.

There is a distinct split in the timeline of file activity. While files 12-16 show consistent activity spanning the first 300 weeks, the files 1-9 show consistent commits around/during week 300, with a few more changes further down the line.

The X-axis represents individual source files (indexed 1 through 16).

The Y-axis measures time in weeks since the earliest recorded commit in the dataset.

The colored dots represent individual commits, color-coded by the author who made the change.

A primary limitation of this analysis is that it relies on quantitative metrics, specifically the number of commits changed, which do not measure the actual complexity, quality, or impact of the code.
