

Executive Summary

The data that was gather from the repository consists of 196 source-file changes across 36 total files with 19 contributors. The data appears to span from June 2015 until March 2026. The data was plotted on a graph below:

The figure contains files on the left side of the graph that were accessed and changed in the repository along with when the files were accessed. The authors are plotted on when they accessed a file and which file and marked in their own colors. The figure also shows that the majority of development was performed by authors scottyab and stealthcopter. Scotty has 74 recorded changes across 34 files, with stealth having 65 changes with 20 files. The file const.java had the most activity inside of it, followed by mainactivity.java. This can conclude that the most prevalent files were handled by two contributors and 11 of the files were only worked on by one contributor. This shows possible concerns that maintenance may not be repaired often and reviewed for each change. Stealthcopter does not seem to be a reasonable name so the authenticity of the files should be checked to ensure non authorized authors are accessing the repository.
