

Executive Summary

For this activity, I analyze how developers have changed an open-source repository over time. This analysis identifies source files based on selected file extensions. In this analysis, source files refer to the original, human readable code written by a programmer before compilation or interpretation. One limitation of this definition is that Kotlin script files may primarily contain build configuration rather than application logic.

RootBeet.java is the most frequently changed source file. It was changed 40 times, substantially more than the next-most-changed file, Const.java, with 17 changes. RootBeer.java was also modified by many different contributors, with Matthew Rollings responsible for 19 of its 40 changes.
